**A C K N O W L E D G M E N T**

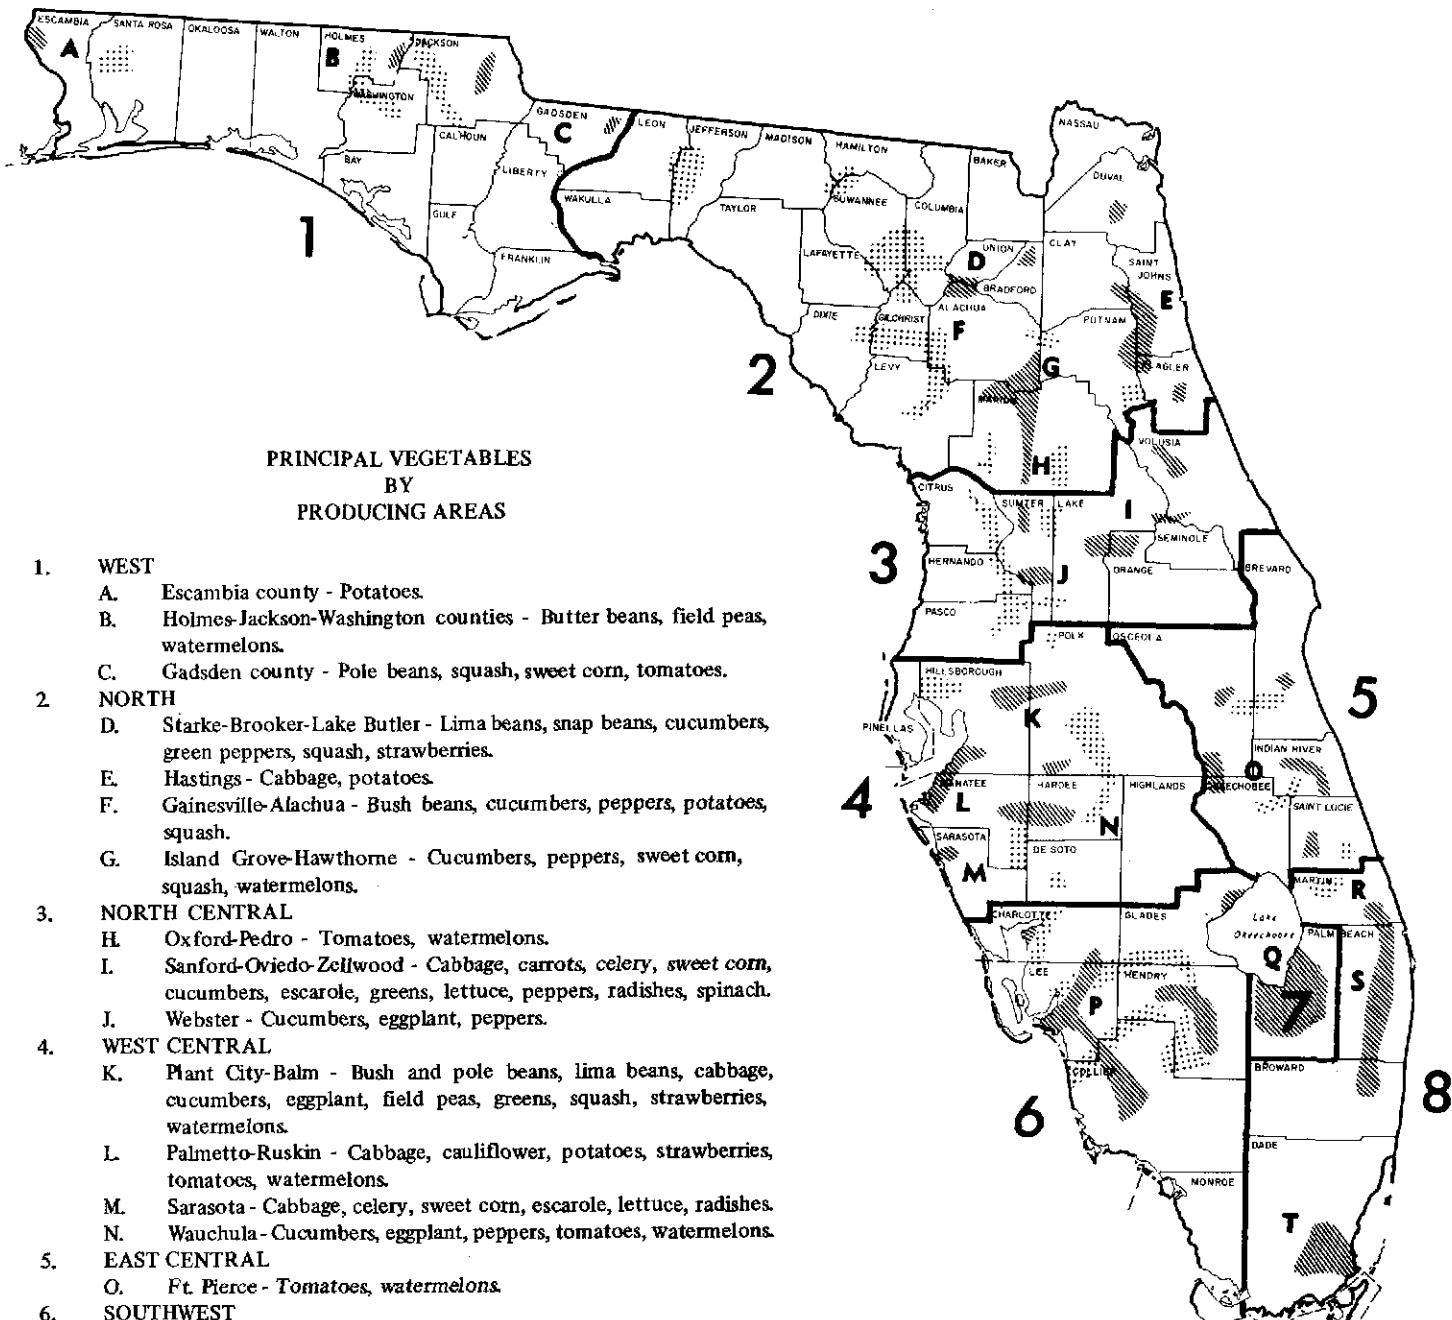

The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida's Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; J. B. Joiner, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Harvey L. Batchelor, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News.

# FLORIDA

## PRINCIPAL VEGETABLES BY PRODUCING AREAS

1. WEST
  - A. Escambia county - Potatoes.
  - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
  - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
  - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
  - E. Hastings - Cabbage, potatoes.
  - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
  - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
  - H. Oxford-Pedro - Tomatoes, watermelons.
  - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
  - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
  - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
  - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
  - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
  - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
  - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
  - P. Ft. Myers-Immokalee - Sweet corn, cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
  - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
  - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
  - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
  - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

Commercial Vegetables

Watermelons

Florida: Usual dates for planting and harvesting vegetables,  
melons, potatoes, and strawberries

Crop	Planting Dates 1/	Usual Harvest Dates							
		Begins			Most Active			Ends	
Snap Beans 2/	Aug 15 - Apr 1	Oct 15			Nov 1 - May 1			Jun 15

## DEFINITIONS AND EXPLANATIONS

**QUARTERLY GROUPS**--During the growing season estimates were prepared for most crops on a calendar quarter to indicate available supplies for shorter periods of time than the entire crop year. The Fall, Winter, Spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

**PLANTED ACREAGE** is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

**HARVESTED ACREAGE** is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

**YIELD** is the acreage production per acre of merchantable quality harvested and sold or utilized.

**PRODUCTION** is the quantity actually harvested and sold or utilized.

**ECONOMIC ABANDONMENT** is that portion of the crop that reached maturity and was of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors; or if harvested, was not sold or utilized for those reasons. Estimates of acreage and production lost because of economic reasons are difficult to define and measure, and are not attempted unless such losses become significant.

**UNIT VALUE** for fresh market sales is the equivalent price received on an f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable

quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

**TOTAL VALUE** is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

**OTHER COUNTIES** include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

**RAIL TRUCK (Piggyback) shipments** are included in the straight rail shipments shown for each crop, unless specified.

**RAIL LOAD FACTORS** represent the average number of packages per rail car based on tabulations of waybills in prior years showing the contents of each car.

**MIXED CARS (RAIL)**--Loadings by stations are pro-rated by commodities, using tabulations of waybills in prior years.

**TRUCK SHIPMENTS** are converted to equivalent carlots on the basis of predetermined load factors. A minor difference of carlot equivalents in the season total obtained by adding the monthly or weekly shipments may exist because of rounding.

**PRODUCTION AND PRICE UNIT**--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

**PRODUCTION AND PRICE UNIT**  
Most Common Unit Estimated Net Weight, Number of Units per Hundredweight,  
Principal Vegetable Commodities, Florida, 1976-77 Crop Season

Commodity	Unit	Est. Net Weight	No. of Units per Cwt.	Commodity	Unit	Est. Net Weight	No. of Units per Cwt.

Lettuce	Cwt.	100	---				

## SUMMARY OF THE 1976-77 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold totaled a record \$560.9 million, up \$36.5 million from the 1975-76 crop year. Although value increased from the previous season, acreage harvested decreased 5 percent. Crops showing the greatest declines in harvested acres were snap beans, sweet corn, eggplant and tomatoes. Crops increasing in value were cabbage, cucumbers, eggplant, escarole, lettuce, potatoes, radishes, "other vegetables," watermelons, and strawberries. Crops with lower values than the previous year were snap beans, celery, sweet corn, green peppers, squash, and tomatoes. Production was less, especially for some crops because of the major freeze last January 18-20 which destroyed much of the winter crop for some commodities. Prices were higher after the freeze for most commodities and this gave an overall increase in value. Cabbage, which rose almost \$29 million, showed the greatest increase in value, followed by "other vegetables" and cucumbers which increased \$13.9 million and \$3.9 million, respectively.

Average yields for snap beans, sweet corn, eggplant, potatoes, squash, and "other vegetables," increased during the year but yields declined slightly for cabbage, celery, cucumbers, escarole, lettuce, green peppers, radishes, tomatoes, watermelons, and strawberries. Improved varieties, cultural practices and weather conditions can affect crop yields considerably.

Season average prices of snap beans, cabbage, sweet corn, cucumbers, eggplant, escarole, lettuce, green peppers, potatoes, and watermelons were higher than a year earlier. Season average prices for radishes, squash, and strawberries were below a year ago.

Land preparation, planting and transplanting were very active in most areas during August. Conditions were generally favorable over most of the farming areas during September. Shower activity increased, alleviating the need for irrigation in many areas. Temperatures moderated in October. Some areas reported locally heavy rainfall. Temperatures were generally cool during November. Strong, gusty winds caused light leaf burn to tender plants in some areas. Harvest gained momentum during October and November.

Cooler, wet weather prevailed over most farming areas during December. There was some light to moderate cold damage to tender crops. A severe cold front invaded the farming areas on Tuesday, January 18. By Thursday

night, freezing temperatures in the low 20's occurred in most areas as far south as Dade County. Most tender crops experienced a complete loss. Salvage harvest of mature fruit began immediately. Growers were busily assessing damage to their fields. Some fields were mowed off to sucker out while others were reseeded and transplanted.

Temperatures moderated in the farming areas in February. Rainfall was generally light and scattered. Acreage planted after the freeze progressed favorably, and the condition of crops surviving the freeze improved. Light frost occurred in some outlying areas in late February.

A cold front moved into the farming areas in early March. Light frost occurred in some west central areas. Damage was generally light. Temperatures began to increase about midmonth, and rose to several degrees above normal in most of the growing areas. Crop conditions improved and plant growth was very rapid.

During April, daytime temperatures were generally warm and nights cool. Rainfall was limited to a few light, widely scattered showers. Crop conditions were variable, ranging from fair to excellent. Harvest was in full swing for some crops while others were declining seasonally.

Conditions were warm and dry during much of May. Rainfall was sufficient enough to relieve shortages the first half of the month. Crops were generally in good condition in most areas. Harvest was very active for some while declining on others. In late May, irrigation was heavy as conditions became very dry.

In June, moderate to heavy thundershowers occurred almost daily in some southern farming areas. Excess moisture caused some slight problems and delayed harvest. Temperatures were normal to above normal. Crops were generally fair to good in most areas.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on affects of weather on crops was provided by Florida Crop and Livestock Reporting Service field men.

## SNAP BEANS

1976-77

Florida growers produced 3.7 million bushels of bush and pole beans during the 1976-77 season. Acreage harvested during the season totaled 29,500 acres, down 21 percent from the 37,500 acres harvested during the previous season. The decrease is due to the freeze January 18-20, 1977, which destroyed much of the winter crop. The average yield for the entire season was 125 bushels per acre, as compared with 119 bushels per acre the previous year. The slight increase in yield was not enough to offset the decrease in harvested acres.

The average f.o.b. price of \$6.29 per bushel was 55 cents more than the previous year and reached an all time record high. Total value, at \$23.1 million, was 9 percent below last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with small acreage grown in Gadsden County and the west central areas.

Earliest supplies of snap beans beginning with the fall season come from West Florida. The north and west central areas, the Everglades and southeastern districts

also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

The fall crop peaked in late November and early December. The winter crop was virtually destroyed by the January 18-20 freeze. Acreage loss was as high as 80-85 percent and production down 90-95 percent in some areas. Harvest was underway again in mid to late March. Production increased until the spring peak in April. Thirty one percent of the marketings took place in April compared with 17 percent in April the year before. The season was over by mid June.

Variable weather influenced last year's bean crop. Heavy rains late September in the Pompano area washed beds, necessitating moderate to heavy reseeding. Soil was packed resulting in slow germination and reduced stands in some fields. During the winter season, the entire crop was virtually lost due to the devastating freeze. As much of the crop as possible was salvaged. Weather during the spring season was generally favorable. Cool, brisk winds at times caused light scarring to pin beans and leaf burn. Quality and yields were mostly good to very good for the spring season.

## CABBAGE

1976-77

Cabbage production in Florida totaled 7.4 million sacks and crates during the 1976-77 season. The gross value was a record \$48.2 million, second only to tomatoes. This was nearly 85 percent more than the previous record of \$26.1 million received for the 1974-75 crop. The average f.o.b. price of \$6.45 per sack and crate was almost three times the average price of \$2.32 received for the 1975-76 crop and more than twice the previous record of \$3.09 set during the 1972-73 season. The price peaked in February when it averaged \$9.45 per sack or crate and compares with the previous February high of \$2.90 received in 1973. The record price and value is attributed to the reduced winter and spring crops caused by the sub-freezing temperatures on the morning of January 18. Cabbage was in short supply throughout the nation for the remainder of the 1976-77 season.

Plantings during the season totaled 17,100 acres, six percent less than the previous season. Acreage harvested totaled 16,300 acres, down 5 percent from a year earlier. The average yield, at 453 sacks and crates, per acre, was lower than last year. The low yield was caused by the January freeze damage to mature and young cabbage. Young cabbage failed to size properly and heads were smaller than usual. This situation continued through the remainder of the season.

Cabbage was available for market from November through June. Sales were about normal for the fall period, but were well below normal during January and February, reflecting the damage caused by the freeze. Volume sold in March and April was near normal but increased in May and June. The peak month continued to be March but was nine percent lower than March the year before.

The Hastings area, which includes Flagler, Putnam and St. Johns counties, continues to be the major producing area accounting for 52 percent of the state's total production, down slightly from a year ago. The north central, which includes Lake, Orange, Seminole and Volusia counties, was second in production accounting for 23 percent of the total. Yields were lower than last season in the Hastings and southern areas but unchanged in the central areas.

Early transplanting and direct seeding were underway by late August and early September. Transplanting was most active from October through January. Some acreage was lost in January and had to be replanted.

First cuttings were made in early November. Harvest increased rapidly until slowed by the January freeze and did not return to normal until March. Volume was heavy through the remainder of the season.

CARROTS  
1976-77

Production of carrots in Florida made rapid gains during the year. There were 1,970 carlot equivalents of fresh and processing carrots shipped out-of-state last season. This compares with 1,311 shipped out during the previous season. Shipments for the fresh market made up 81 percent of the total shipped out-of-state. Carrots are not part of the regular estimates program, therefore, data on acreage and production are not published.

The muck soils around Lake Apopka, near Zellwood and the Everglades, provide a good medium for growth. The mini or finger carrot harvest usually begins

in late October and is complete by the end of May. Regular-sized carrots are harvested from November through June. The peak harvest period last season was January through May.

The major freeze of January 18-20 last season destroyed considerable young acreage, and tops of older crops were damaged. With the exception of the freeze, growing conditions for the season were generally favorable. Quality was good throughout the season. However, average size was somewhat smaller than normal, especially in February and March after the freeze.

CELERY  
1976-77

Florida celery marketings of 5.8 million crates were harvested from 10,100 acres during the 1976-77 growing season. The average yield of 578 crates per acre compares with 687 crates for the previous year.

Prices were improved over the previous season. Celery averaged \$6.70 f.o.b. per crate compared with \$6.14 in the 1975-76 season. Prices averaged below a year earlier for the fall quarter but were above year earlier levels for the winter and spring quarters. The crop was valued at \$39.1 million, a decline of 5 percent from the previous season.

The Everglades, with 85 percent of the harvested acreage, was the foremost area of production through the season. The north central area, supplemented by light volume from the Sarasota area, accounted for the remaining 15 percent of acreage and provided continuing supplies throughout the season.

Plant bed preparation and seeding was underway by early June. Transplanting became active in the Everglades and Zellwood around mid-August and gained momentum as the season progressed. Planting in the Everglades continued through late March, while some acreage in the

north central district was still being seeded in late April. Growers in Sarasota planted mostly from October to March.

Light harvest began in late October. Growing conditions were hot and humid in early fall. The crop made good growth. The major freeze in January caused some damage and slowed growth. Yields were reduced by heavy stripping caused by cold and leaf miners. However, in the late winter and spring, size and quality improved. The market improved during the winter and early spring and trading was active. By late spring the market was weakened and prices dropped. Approximately 6 percent of the crop was passed or not harvested for various reasons. This was slightly below the normal abandonment. Growers passed some acreage in order to maintain good quality.

Celery production was most active December through May. Cutting declined seasonally in May and June and was completed by July 1 in all areas.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Their field supervisors provide acreage and production data. In cooperation with the Committee, these data are assembled into weekly and monthly reports.

CHINESE CABBAGE  
1976-77

Chinese cabbage is grown primarily at Zellwood and in the muckland of the Everglades. Harvest was underway by early November. Volume was light through November but increased to a good level in December and January. Production peaked in March and April. Good supplies were available from December through April. During April, Zellwood was providing good volume while production in

the Everglades was declining seasonally. The season was over by late May.

Yields and quality held up well during most of the season. The crop did not suffer significantly from cold weather or disease problems. Shipments for the season totaled 498 carlot equivalents, up from 461 carlots the previous season.

SWEET CORN  
1976-77

Florida, the nation's leading sweet corn producer for the fresh market, marketed almost 12 million crates during the 1976-77 season. Production decreased 9 percent from the previous year. Growers harvested 50,300 acres, down 12 percent from the 57,400 acres harvested during the 1975-76 season. The freeze January 18-20 destroyed much of the winter crop. Yields averaged 238 crates per acre statewide compared with 231 crates a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f. o. b. price of \$3.68 per crate was 4 cents above the average for the previous year. The total value of the crop was \$44.1 million, down \$4.1 million from the \$48.2 million received for the 1975-76 crop. The value of sweet corn ranked third in the state in vegetable crops and was exceeded by only the values of cabbage, and tomatoes.

First plantings of the season were underway in the Everglades in July. Seeding on the East Coast got underway in late September and increased rapidly. Plantings were interrupted by rains in early to mid November in the East Coast area. Below normal temperatures slowed plant growth. First harvest began in the Everglades in the week ended September 27th and reached a fall peak in late

October. The declining harvest in the Everglades during December was partially offset by the lower East Coast and Dade County.

Harvest of the spring crop in the Everglades was underway by early April. The Everglades became the main source of supply in late April as the East Coast and Dade County phased out. The transition of harvest from the Everglades to Zellwood occurred in mid-May. Zellwood increased to full supply by late May. Lake County provided a good volume in June. The season was complete in early July.

Small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during the fall growing season was generally favorable. The freeze damage January 18-20 was light to moderate in the Everglades but almost a complete loss of older corn occurred in the East Coast and Dade County areas. However, a few growers were able to salvage small quantities of mature corn in all growing areas. Frost caused some foliage burn to early plantings during late February and early March. The growing season was mostly favorable in the Zellwood and Everglades areas during the spring.

CUCUMBERS  
1976-77

Florida production of fresh market cucumbers during the 1976-77 crop year totaled 3.8 million bushels, down 12 percent from the 1975-76 crop. The 16,100 acres planted was up 100 acres from the previous year and continued the upward trend started two years ago. Harvested acres totaled 15,000 compared with 15,400 harvested a year earlier. Average yield per acre, at 253 bushels, was down 29 bushels from the previous year. Total production was valued at \$19.7 million compared with \$15.8 million for the previous year. The f. o. b. price for 1976-77 averaged \$5.19 per bushel, up considerably from \$3.64 received for the previous year's crop.

Supplies in 1976-77 were generally available from September through June. However, February supplies were destroyed by the January 18-20 freeze and movement in March was very light. Much of the recorded shipments moving out-of-state January through March are from off-shore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 45 percent of the planted acreage during 1976-77, is the largest area. The west central area accounted for 27 percent of the planted acres in the state. The areas in the west, north central and southeast provided the remaining crop.

Weather during much of the growing season was mostly favorable. Rains caused only minor problems on young acreage during early fall. In early to mid November, strong, cool winds and frost caused light to moderate burn to tender foliage. Below normal temperatures slowed plant growth. The January 18-20 freeze destroyed all young plants out of the ground and the small acreage coming into production for winter harvest. Conditions for the spring crop were mostly good. Very good yields were obtained. Size, quality and color were very good most of the season.

EGGPLANT  
1976-77

Plantings of 2,250 acres were 6 percent below the 1975-76 season. Yields averaged 701 bushels per acre, 13 bushels above the previous season and an all-time record high. Weather was generally very favorable during much of the growing season with the exception of the winter season. However, during late October and early November, strong, gusty winds knocked plants over, broke limbs in some fields and caused some scarring of small fruit. This damaged fruit resulted in reduced packout. The January 18-20 freeze destroyed 85-90 percent of the standing acreage in some areas and the entire crop in other areas. Growers salvaged as much mature fruit as possible. Light harvest was underway again by late April. Yields, quality, fruit color and packout were very good for the spring season.

Production of eggplant decreased to 1.4 million bushels, .2 million bushels below the record production last year. Total volume sold increased to \$5.3 million compared with \$4.8 million a year earlier. The increase was due to the higher season average price of \$3.90 per bushel compared with \$3.06 a year ago. The fall, winter and spring crops averaged much higher in price than a year earlier.

The distribution of marketings was generally normal with exception of the winter season. Harvest began in October, reached a peak in November, and was virtually curtailed in late January. Harvest began again in late April and reached a peak in May. Harvest was virtually complete by early July. The southeast area around Pompano continued to dominate with 60 percent of the harvested acreage. The northern and central areas combined contributed 30 percent of acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in western, northern and central areas are for fall and spring harvest only. Those areas received too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in early October. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas until the freeze, and then moved back northward in the spring.

ESCAROLE-ENDIVE  
1976-77

Production of escarole and endive during the 1976-77 season totaled 3.1 million crates, unchanged from a year ago. The 6,000 acres harvested was up 200 acres from the previous season. Yield per acre averaged 513 crates compared with 532 crates the previous year. Prices during the season averaged \$4.07 per crate, compared with \$3.19 a year earlier. The total value of sales, at \$12.5 million, was 26 percent above the previous year and a new record high.

The Everglades, which had 72 percent of the harvested acreage in the 1976-77 season, began seeding in early September. Weekly planting schedules continued through early April. Light harvest began in late October and supplies were continuous through May. The mucklands around Zellwood provided good volume in the late spring

months. Smaller acreage grown on Lake Placid and Sarasota mucklands also furnished supplemental supplies during much of the season.

Sales started relatively slow in October but increased considerably to a good volume by November. Marketings reached peak levels in March. Good volume continued into May. Harvest declined seasonally and was over by June 1.

Growing conditions were generally favorable during most of the season. Winds caused some blowing soil problems in early January. The freeze damage January 18-20 was mostly light to moderate. Young plants were hit hard. Damage on older plants was confined to outside leaves. Quality of escarole and endive was mostly good throughout the season.

LETTUCE  
1976-77

Florida lettuce growers produced 1.4 million hundredweight during the 1976-77 season. This was 3 percent below the record high production of the previous season. A 19 percent increase in harvested acreage was more than offset by a reduction of 33 hundredweight per acre. Average yield, at 151 cwt. per acre compares with the 184 average for the previous season. The season average f.o.b. price of \$12.34 per cwt. was \$1.99 above the previous season. Prices for the fall and winter crops were higher than a year earlier while spring prices averaged lower.

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. These types include the predominant iceberg and romaine as well as Boston, bibb and leaf types. The Everglades muckland accounted for 82 percent of the planted acreage and was the source of a continuous supply which began in late October and ended in late May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during much of the season.

Seeding was underway by early September. All areas were actively planting by the end of the month. The Everglades and Sarasota areas had continuous plantings through March. Supplies peaked in March and April and then declined seasonally until harvest was completed in late May. Supplies from the Zellwood area are generally light during the winter months. Moderate supplies are available from this area in the fall and spring.

Harvest was underway by late October with light supplies through November. Volume of all types increased in December with growers cutting in most areas. The Everglades provided the bulk of the volume during the winter period. Production was over in all areas by June 1.

Growing conditions during the early fall were hot and humid. Growth was generally good. The major freeze in January killed some young crops, and outside leaves of older crops were damaged. Some stripping was necessary. Some specialty types were destroyed. Supplies gained during March. Quality was mostly good.

PEPPERS  
1976-77

During the 1976-77 season, Florida produced 6.7 million bushels of peppers from 16,800 acres. The average yield of 400 bushels per acre was 12 percent below the 454 bushels the previous year. The January freeze was the major contributor to the lower yield. Production was 7 percent below the previous year.

The season average f.o.b. price was up from \$5.45 per bushel the previous year to \$5.66 per bushel last season. The total value of \$33.1 million was 3 percent below the previous year. Prices were especially good during the winter period but production was reduced by the January freeze. Marketings were light in October but increased to a good level by December. The freeze then reduced supplies until the spring crop began in April. The peak production occurred in May. The season then declined and was mostly over by the end of June. The 26

percent increase in total planted acreage was the result of a 30 percent gain in the heavy producing southwest area, a 53 percent increase in the west central area and a 50 percent increase in the southeast. The north and north central areas declined. The southwest accounted for 60 percent of the State's total pepper acreage. The southeast had 18 percent; the north central area, 9 percent; the north, 7 percent; and the west central area, 6 percent.

Heavy rains during late September and early October leached fertilizer and caused some problems. Spot resetting was necessary in some fields. Fields with plastic generally came through in better condition. The crop suffered heavy loss from the January 18-20 freeze. Supplies were greatly reduced until the spring crop began in April. Growing conditions were generally good during the spring period. Yields were very good.

POTATOES  
1976-77

Production of potatoes in 1977, including both the winter and spring seasons, totaled 6.2 million hundred-weight, about one percent less than in 1976. A total of 30,500 acres were planted, compared with 31,900 acres planted the year before. Of this total, 30,100 acres were harvested, 900 acres less than the preceding year. The value of the crop was \$42.5 million, up one percent from 1976.

The average yield in 1977 was a record 206 cwt. per acre. The winter crop averaged 180 cwt., well below the winter crop of 1976. The subfreezing temperatures on the morning of January 20 caused heavy damage to the late planted winter acreage, reducing the overall yield of the winter crop. The spring potato acreage grown in the Hastings area averaged a record yield of 220 cwt. per acre and produced the largest crop since 1969. The high yield in this area accounted for the record yield in the State. Spring potatoes grown in other areas of the State averaged 185 cwt. per acre.

The 1977 season average price of \$6.84 per cwt. was 18 cents above the average in 1976, but below the re-

cord price of \$7.72 received in 1974. Very low prices at the end of the spring season kept the season average price down.

The winter crop in South Florida is mostly of the "red-skinned" varieties which are sold primarily for table stock. The spring "white skinned" varieties grown in the Hastings area are used mostly in making chips. However, more "reds" are being grown for the table stock trade than in previous years.

The winter potato crop was off to a good start in early January. The hard freeze on the morning of January 20, damaged plantings and delayed digging. Harvest of the winter crop was not complete until late May. Early plantings were not hurt by the freeze, but yields were reduced on the late plantings. The spring crop at Hastings was not affected by the freeze. Plantings were delayed temporarily but completed on time. Digging, underway by early April, progressed rapidly to the May peak and was completed by the last week of June. Nearly 60 percent of the crop was shipped in May.

RADISHES  
1976-77

In 1976-77, radish plantings amounted to 31,000 acres compared with 29,200 planted the previous year. Acres harvested totaled 27,300 compared with 25,700 in 1975-76. Yields per acre averaged 291 cartons compared with 293 cartons the previous season. The crop was valued at \$16.3 million compared with \$15.8 million a year earlier. The average f.o.b. price was \$2.06 per carton, down 4 cents from the previous year.

A good supply of both red and white radishes were

available from Zellwood, Lake Placid and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in November while the spring peak occurred in March and early April. The January 18-20 freeze caused considerable damage to radishes and many had to be replanted. Seeding of the 1976-77 crop was underway in the Everglades and north central areas in early September. Harvest was underway in early October and became quite active in mid-November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING  
1976-77

Spinach statistics have not been published separately for Florida since the 1973 season in order to avoid disclosure of individual operations. However, data for these seasons have been included in "Other Vegetables" in the overall summary table. Also, data for historical

years are published in order to show the relative importance of this crop. Yield per acre was below a year earlier because of the January cold damage. Most of the crop is grown in north central and north areas.

SQUASH  
1976-77

Florida's production of squash during the 1976-77 season, at 1.9 million bushels, is a record high. Harvested acreage totaling 12,000 acres, increased 5 percent from the previous year. The yield at 158 bushels per acre was up 4 bushels from the previous year.

The average f.o.b. price at \$5.89 per bushel was down 64 cents from the all-time high of last season. The increase in production was not enough to offset the lower f.o.b. price resulting in a lower value. Total f.o.b. cash receipts amounted to about \$11.2 million. Prices were generally favorable October through March, before tapering off in the spring.

Florida produces acorn, butternut, yellow crook-neck, yellow straightneck, white and zucchini squash. Dade County with 29 percent of the state's harvested acreage in 1976-77, produces yellow crookneck almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash

grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring seasons.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1976-77 season got off to a fair to good start as rains caused only minor problems. Marketings increased to a fall peak in November and early December, before showing a seasonal dip during the winter months. Cold winds in early January caused light to moderate foliage burn. The January 18-20 freeze destroyed all acreage that was out of the ground. Recent plantings began to emerge and harvest was underway in about 45 days. Weather was generally favorable during the spring quarter, and production was heavy. Peak marketings for the 1976-77 season occurred in April.

STRAWBERRIES  
1976-77

Florida strawberry growers produced 2.1 million flats of berries during the 1976-77 season, up 4 percent from the previous year. Harvested acreage totaling 1,500 acres, increased 7 percent, and more than offset a decrease in yield. The average f.o.b. return per flat was \$4.21, down 12 cents from the previous season's average. The total value of the crop was a record \$9.0 million, 1 percent above the previous highest established a year earlier.

Laying of plastic and other field work were in full swing by early October in the Hillsborough and Dade County areas. Transplanting began by mid-October and was com-

pleted by late November. Light harvest was underway by mid-December in Dade County and by late December in the Plant City area. Early harvested berries were primarily for local use and roadside stands. Light shipments began in late January and reached a peak in March. Most of the commercial harvest was completed by late April and growers opened fields to the public for U-Pic operations. The crop was damaged considerably by the January freeze. Growers using irrigation water or sprinklers had less crop loss than those who did not use these systems. Fruit size and quality were mostly good. Warm weather in February and March hastened maturity and resulted in heavy production during the peak season.

TOMATOES  
1976-77

The total value of the Florida tomato crop for fresh and processing utilization decreased from last season. The \$155.0 million was 5 percent below the previous season's record value. The main factor contributing to the decrease was the freeze last January 18-20 which destroyed much of the winter crop.

Total production of 25.5 million 30-pound carton equivalents was 17 percent below the previous season. The fresh market channel utilized 95 percent of the production and the remaining 5 percent was for processing. The Palmetto-Ruskin area accounted for 46.5 percent of the production; Dade County, 14.0 percent; the southwest, 25.9 percent and the Ft. Pierce-Pompano area, 10.5 percent. The remainder of the production was in the west, north, and north central areas.

The state average yield, at 712 (30-pound) cartons per acre, was down 53 cartons from the previous season. This decrease was due to the major freeze damage in January. Dade County supplies the bulk of winter tomatoes. Fall shipments peaked in December, which accounted for 19.5 percent of the season's market sales. Spring production reached a peak in May, which amounted to 37.4

percent of the season's total. Tomatoes are usually harvested continuously from late October to mid-June.

The Palmetto-Ruskin area continued to be the acreage leader, with 13,990 acres harvested. The southwest ranked second, harvesting 7,330 acres. Dade County harvested 7,815 acres, and the Ft. Pierce-Pompano area, 3,765 acres. There were 1,100 acres harvested in the north, north central, and west areas. This was more than double last year's acreage harvested for these three areas. Most of this new acreage was in Gadsden County.

Seeding and transplanting were underway in all areas in August. Rains in late September delayed plantings and damaged young seedlings in low areas. Damage was minimal. Mostly favorable weather prevailed throughout the remainder of the fall season. Much of the winter crop was destroyed by the major freeze last January 18-20. Growers salvaged as much mature fruit as possible. Weather conditions were generally favorable for the spring season, although there was some light fruit scarring in mid to late April. In mid-May, leaf miners and locally heavy showers contributed to the rapid decline in plant condition in the Palmetto-Ruskin area.

WATERMELONS  
1976-77

Watermelon plantings during the 1977 season totaled 65,000 acres, the same as planted in 1976. Of this total, 51,000 acres were harvested, nearly 7 percent less than the year before. The crop of 8.9 million hundredweight was down by 10 percent from 1976. The average yield for the state was 175 cwt., down slightly from a year ago. The yields varied considerably over the State with the western counties averaging only 100 cwt. per acre and the southern counties averaging 212 cwt. per acre.

The value of the crop totaled \$26.5 million, about two percent more than the previous season but 25 percent less than the record \$35.2 million received for the 1975 crop. The average price received by growers was nearly 3 cents per pound compared with 2.6 cents in 1976.

The watermelon season usually begins in the Ft. Myers-Immokalee area in late March and early April, depending on weather conditions. The season progresses into the central growing area during May while the northern part of the state provides the heavy June volume. Harvest begins during June in the west or Panhandle and continues into July.

Seeding was underway in the Immokalee area by mid-December. Early plantings were up to good stands

but were killed by the sub-freezing temperatures on the morning of January 18. Extensive replanting was necessary where the crop was up or just emerging. The first melons did not move from this area until May.

Planting was active in the north and west by mid-March. Extremely dry weather slowed seed germination and plant development. The drought caused heavy abandonment of acreage both in the north and west.

Harvest was underway by late May in the north. Volume increased rapidly and reached the peak by mid-June. Size and quality of melons were variable. Melons from irrigated fields were of good size and quality. Those from non-irrigated fields were mostly too small for the trade, however some entire fields were abandoned. The price remained low during most of June because of the heavy volume and the large number of small melons.

The west was hit the hardest by dry weather. More than half of the crop in the area was completely abandoned due to the extremely dry conditions. Average yield was only 100 cwt. per acre and would have been lower without irrigation. Many fields were picked only once. Fair supplies continued into July but declined sharply the last half of the month when the season ended.

OTHER CROPS  
1976-77

Cantaloups are grown primarily in the southwest and north central areas of Florida. A considerable proportion of the production is sold through local markets. The peak harvest period is May and June. Harvest begins in the southwest and moves northward as the season progresses.

Acreage remains at a relatively low level. However, researchers are working to develop several new varieties that will be adapted to Florida's soil and climate. There appears to be some promise that acreage may experience an upward turn in the future.

Cauliflower is available from mid-January into April. Supplies are grown mostly in the Ruskin and Zellwood areas. Light supplies are grown in the north. There has been a renewed interest in cauliflower production in the Zellwood area recently.

Sub-tropical vegetable production declined during the year. The major freeze on January 20 destroyed some acreage in Dade County where most of the sub-tropical vegetables are grown. Commercial production began in the early 60's. Sub-tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by its scientific name is listed below. Other common terms for the various vegetables are shown in parenthesis. The crops consist primarily of boniatos-ipomea batatas (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagittaeifolium (dasheen, yautias) and yuca-monihot esculenta (sweet cassava). Miami is an important point of consumption for the Florida production. Also, a considerable amount is shipped to Tampa, New York City and Philadelphia.

Collard, turnip, mustard and other greens are grown for both fresh market and processing markets. These crops are grown throughout the state and centered

around the large population centers and in the muck soils of the Everglades and Zellwood areas. Good volume is available from November through May with the peak shipment period occurring January through March. There was an increased interest in the cold hardy greens after the January freeze. Shipments totaled 431 carlot equivalents compared with 213 recorded for a year earlier.

Okra is grown in many areas of the state during the warm seasons of the year. However, Dade County produces okra most of the year for local uses as well as for shipment to out-of-state markets. Good volume occurs October through June with May and June being the peak months.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily at local markets. Supplies of dry onions have been light but acreage is expected to expand this year.

Parsley is available in both the curly and plain types. The bulk of the commercial supplies that are shipped to other states are produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota and Lake Placid areas.

Southern peas are grown primarily in the northwest, west central and the Everglades areas of Florida. Dade County also produces a good volume. Light supplies are available from September through December. Heavy movement occurs during the April through June period. A high percentage of the crop goes for processing or is sold through local markets.

Watercress is available year round. The major source of supply is Oviedo. Most of the production is shipped to northern and eastern markets in the United States. A small volume is sold through State Farmers Markets.

Note: Pompano interstate shipments of Mexican produce imported through Arizona and Texas border points, 1976-77 crop year. Cucumbers 34 carloads; eggplant 2; tomatoes regular type 16; cherry type 1; total 53 carloads. This data has not been previously reported in the above tables. There was an additional amount of West Mexico produce brought into Florida for sale within the state, especially tomatoes for Jacksonville, Plant City and Tampa repackers.
